Module 05: Operations And Governance

Last updated: April 29, 2026.

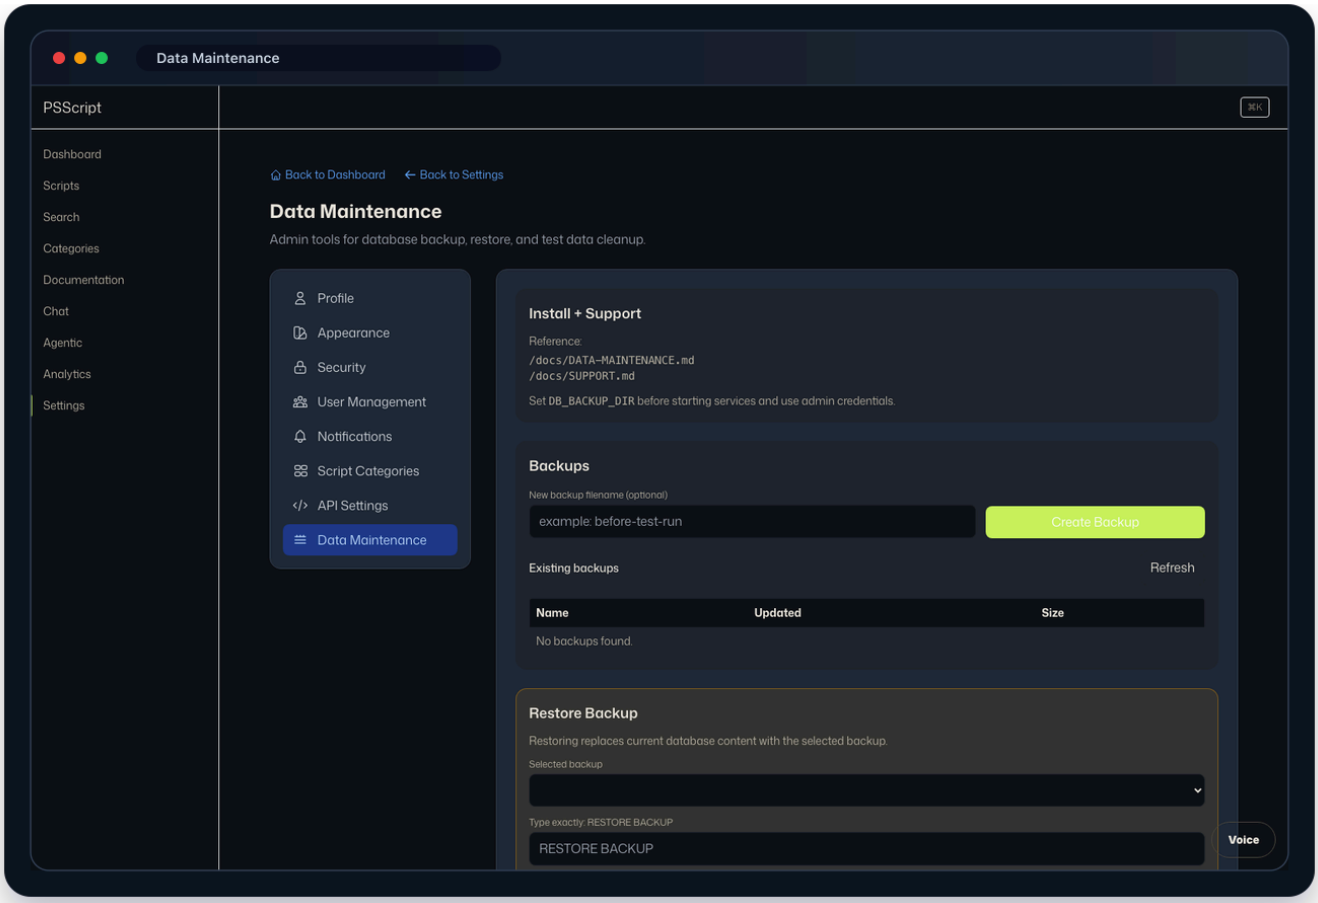
Objectives

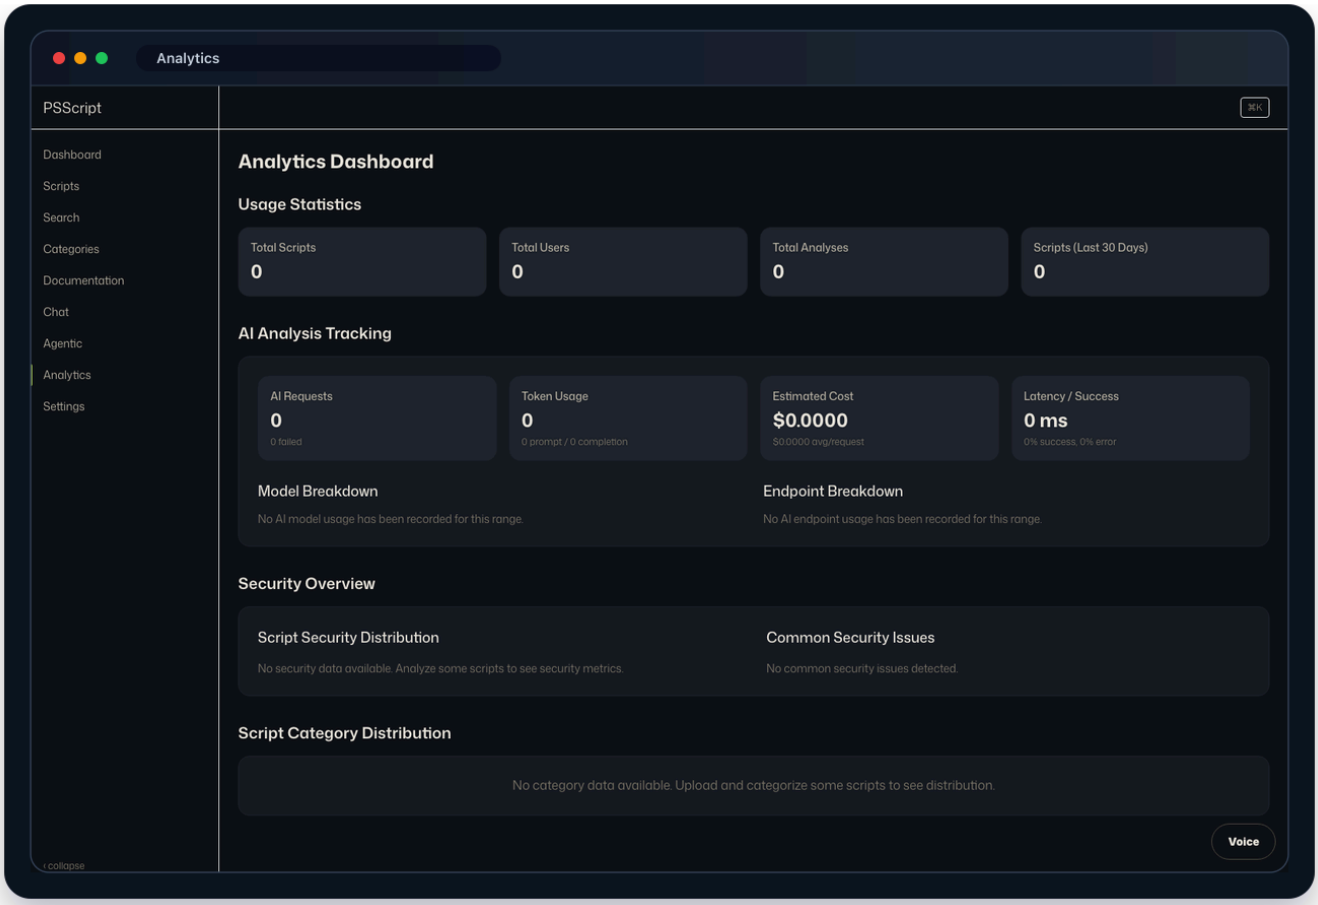
- Monitor Netlify and Supabase production state.
- Review analytics and script activity.
- Use admin data maintenance safely.
- Confirm mobile UI health.

Walkthrough

1. Open Analytics and review usage/cost indicators.
2. Check `https://pstest.morloksmaze.com/api/health`.
3. Review the latest Netlify production deploy and Function logs.
4. Review Supabase Auth/database logs for the same time window if a data issue is reported.
5. As an admin, open Settings -> Data Maintenance and confirm backup controls are available.
6. Verify mobile dashboard and navigation screenshots match current behavior.
7. For upload, delete, export, or data maintenance incidents, collect both the browser route and hosted API response.

Operations Visuals





Support Escalation Ladder

Attach route, screenshot, deploy id, Netlify Function logs, Supabase log window, expected result, and actual result.

Sev 1 - Production outage or data-loss risk

Cannot log in, data missing, destructive maintenance risk, broad API outage

Sev 2 - Critical workflow blocked

Upload, analysis, PDF export, delete, backup, or approval workflow fails

Sev 3 - Degraded workflow

Slow response, one route broken, assistant degraded, mobile issue without data risk

Sev 4 - Documentation or cosmetic issue

Copy, screenshot, minor layout polish, support article mismatch

Operational Signals

Signal	Source	Target
App health	Netlify production URL	app shell loads
API health	`/api/health`	healthy or degraded with reason
Auth gate	Supabase + `app_profiles`	disabled users blocked
Data maintenance	Settings -> Data Maintenance	admin only, backup first
Export	script analysis PDF	correct PDF download
Mobile	phone viewport	no overlap
Upload limit	upload screen	hosted 4 MB maximum
RLS	Supabase policies	users can access only authorized records

Governance Evidence

Event	Evidence to keep
New script	Script id, title, owner, category, upload timestamp
Analysis complete	Criteria version, score, findings, PDF export
Remediation complete	Updated version, accepted findings, reviewer note
Delete complete	Script id, title, user, timestamp, result
Data maintenance	Backup id, action, confirmation text, admin user
Incident	Screenshot, route, deploy id, Function logs, Supabase logs

Verification Checklist

- Production health endpoint responds.
- Netlify deploy logs are reachable.
- Supabase logs show no active auth/database incident.

- Admin backup list loads.
- Mobile navigation works.
- Support evidence is enough for another person to reproduce the issue.
